Description

Name Convention Management: Naming Convention Builder

- Define Naming Conventions, with drag and drop features to be able to detail the different types of components that make up a naming convention. [It's not fixed (what does this mean?), We can drag and drop fields multiple times based on the type of the schema]
- Will enable the IT Administrator to define what components, sequence, and connections will be between components to produce a naming convention
- Able to define a naming convention within the UI, which is composed of naming components such as Alphanumeric characters, iterators, static-values, or a key-value look up pair.
